Trustworthiness Intent CAMARA API FRONT Research Group

Mr. Panagiotis Pavlidis
R&D Software Engineer
p.pavlidis@iit.demokritos.gr

Dr. Harilaos Koumaras
Head of FRONT Research Group
koumaras@iit.demokritos.gr

- Enable developers and applications to request and receive an assessed trust posture across trust categories as high-level intents, without specifying low-level network configurations
 - **(Security, Privacy, Reliability, Resilience, Safety)**
- Service Management / Orchestration API
 - Scope for the CAMARA API
- Operator assurance orchestration
 - Usage of the resulting scores for driving internal policy/assurance workflows
 - Existing CAMARA capabilities (e.g., QoD, verification, fraud signals) can be applied as a result from trust scores to bring the system to the Level of Trustworthiness that is requested

TrustWorthiness Intent API (1)

Input Data

Paremeter	Format	required
type	String	mandatory
serviceId	String	Mandatory
data	Array of (label,text)	mandatory

Label

- Privacy
- Security
- Reliability
- Resilience
- Safety

Text

User-input text describing the intent

TrustWorthiness Intent API (2)

Response Data

Paremeter	Format	required
intentId	String	mandatory
assetId	String	Mandatory
data	Array of (label,score)	mandatory
overall_trustworthiness_level	number	mandatory

Score Semantics

Score Ranges	Score bands/profiles
0.0 - 0.2	Best-effort profile
0.2 - 0.5	Baseline profile
0.5-0.8	Enhanced profile
0.8-1	Critical profile

Action Points from previous meeting - AP1

AP1:
Make the proposal more telco operator capability to differentiate it from AI-trust scoring, which does not require the telco.

Trust Categories	Telco capabilities
Security	SIM/Device/Identity Authentication
	Fraud/anomaly detection signals
Privacy	Network slice isolation
	UPF traffic segregation
Reliability	5QI indicators
	QoS enforcement
	Device Location cell coverage area
Resilience	5QI Indicators
	On-demand slice creation
	Service Continuity / mobility robustness
Safety	5QI indicators
	Emergency service prioritization

Action Points from previous meeting - AP2

AP2: Standardize the normative definition of 0-1 score to make multi-operator interoperability more realistic.

CAMARA
THE TELCO GLOBAL API ALLIANCE

Score Ranges	Profiles	Normative Semantics
0.0 - 0.2	Best-effort	SIM Authentication
0.2 - 0.5	Baseline	SIM/Device Authentication, Network slice isolation, 5QI Indicators
0.5-0.8	Enhanced	Baseline profile + Identity Authentication, UPF traffic segregation, QoS enforcement, on-demand slice creation
0.8-1	Critical	Enhanced profile + Fraud anomaly/ detection signals, Device Location cell coverage area, Service Continuity / mobility robustness, Emergency service prioritization

Action Points from previous meeting - AP3, AP4

CAMARA
THE TELCO GLOBAL API ALLIANCE

- ▶ **AP3: Focus only on POST/intents for now, and leave the subscriptions part for a future version.**
- ▶ HTTP POST Method only
 - Monitoring(subscription) only for reference
- ▶ **AP4: Given the risk involved in entering free text (personally identifiable information/confidential data), apply protective measures in the proposal.**
- ▶ Operator input validation
 - Automated detection and filtering of Personal Identifiable Information(PII)
- ▶ Data Minimization
 - Processing intent semantics against raw text
- ▶ Role-Based Access Control and encrypted intent data (e.g. SSL/TLS encryption)
- ▶ Logging Protection and Retention Policy
 - Sensitive information must not be stored in logs
 - Intent raw data should be discarded after trust assessment is completed

5G/6G Athens Experimentation Platform

CAMARA
THE TELCO GLOBAL API ALLIANCE

A PoC of the Trustworthiness Intent API has already been implemented at the Athens 5G/6G Experimentation platform following research performed under ENVELOPE, SUNRISE-6G and SAFE-6G European Horizon projects.

Thank you
